

Environment-/ Energy policy

Environment protection, environment- and energy oriented management are important management tasks and are anchored in leadership principles. The resources and information necessary to achieve the strategic, operational objectives and for continuous improvement are being made available.

Raw materials, energy, water and other goods are to be used sparingly so that the resources are conserved and environmental impact is also reduced.

In the long run energy consumption is to be reduced and the energy efficiency is to be increased in a continuous improvement process.

Environmental compatibility of the production processes and operation sequences are to be improved constantly.

Emergence of waste and emission and the energy consumption are always to be reduced.

The above stated basic principles are taken in to account at the time of procurement, design and planning of all procedures and processes.

Environment - and energy relevant laws, official charges and the energy obligations determined in the environment and energy management are to be seen as minimum requirement.

Every employee in his area of work is responsible for the adherence of statutory and intra-plant regulations. Information, trainings and motivation for eco and energy sensitive behavior form the basis for this.

Environment and energy policy is the basis for functional environment and energy management. The defined objectives will be checked and updated on a regular basis by the most senior manager.
